## Legacy industry issues

Disconnected FM and  
Asset Systems

Static asset register  
spreadsheets that quickly get  
out of date

Poor visibility of required  
asset replacements

## FMClarity solution

Manage FM & Asset  
anywhere with tightly linked  
asset and work order data

Real-time alerts of  
underperforming assets

Live asset lifecycle  
forecasts

FMClarity has partnered with Virtual Building Information System (VBIS) in the development of FMC Assets, to become the first VBIS Technology Enabled FM Software. The Victorian Digital Asset Strategy (and now Queensland) recommend VBIS for the management of government assets.

Asset and Facilities Management systems no longer need to operate in isolation. Whether you have a full, partial, or no asset register, with FMClarity, decisions are based on live data rather than out-of-date annual audits. VBIS enablement allows for a granular and uniform level of asset identification, providing powerful comparisons across your portfolio and the market. This allows you to cut through the noise, identifying the assets that really require attention, as well as have real-time asset lifecycle plans based on actual requirements.
