## The Australia-modified Karnofsky Performance Scale (AKPS)

This scale gives us an indication of your level of function. Please complete this weekly. If you are unwell you can tell your carer your score and they can enter it on your behalf.

**Who is filling in the AKPS?**

☒ Patient ☐ Carer ☐ Nurse ☐ Other

AKPS ASSESSMENT CRITERIA	SCORE
Normal; no complaints; no evidence of disease	<input type="radio"/> 100
Able to carry on normal activity; minor sign of symptoms of disease	<input type="radio"/> 90
Normal activity with effort; some signs or symptoms of disease	<input type="radio"/> 80
Cares for self; unable to carry on normal activity or to do active work	<input type="radio"/> 70
Able to care for most needs; but requires occasional assistance	<input checked="" type="radio"/> 60
Considerable assistance and frequent medical care required	<input type="radio"/>

**The Symptom Assessment Scale (SAS)**

Monitoring and addressing your symptoms are very important to your Palliative Care Team. Your nurse will regularly review your scores and will call you if needed. Ideally these scales should be completed in consultation with the patient, however if this is not possible, then a proxy is acceptable.

**Who is filling in the SAS?**

☒ Patient
 ☐ Carer
 ☐ Nurse
 ☐ Other

For each symptom, please select a number between 0 and 10 that most closely matches how you have felt over the last 24 hours.

A score of 0 means the symptom is absent.  
A score of 10 means you are having the worst possible experience with that symptom.

# Methods

- ❖ 37 patient-carer dyads & 6 single patients in study
- ❖ 26 semi-structured interviews with
  - 20 patient-carer dyads
  - 2 patients without carers present
  - 2 single patients
  - 2 bereaved carers
- ❖ Interviewed about
  - their experience of palliative care telehealth
  - & GP case conferences (7)
- ❖ Audio-recorded, transcribed verbatim, thematic analysis

# Interview Demographics

- ❖ Ages: 49 – 92yrs
- ❖ Patients: ♀ 12      ♂ 8
- ❖ Carers: ♀ 13      ♂ 5
- ❖ Diagnoses: urological, pancreatic, lung, breast, colorectal, other gastrointestinal, prostate cancers, cardiovascular disease, skin, bone/soft tissue, other non malignancy, haematological
- ❖ Patient AKPS at interview:  
30 (almost completely bedfast) through to  
80 (normal activity, some signs or symptoms of disease)

# Themes

- ❖ Keeping in touch: remote care
- ❖ Willingness & motivation to participate
- ❖ Complexity & simplicity of reporting
- ❖ Strategies to manage challenges
- ❖ Palliative care here in our home

# Keeping in touch

## ❖ Comfortable, confident, reassured they know

*"It makes sense & it gives you a sense of confidence because you know that, even though they don't answer, at least they are registering it."*

Caroline, 64 yrs

## ❖ More honest with clinicians, more honest with me

*"It is handy for me because over the last what, sort of three months, symptoms have been changing & moving around. So instead of me trying to remember all that when I am in there, I can do it as I go along."*

Mark, 49 yrs

## ❖ Critical importance of clinician follow up

*"It would be nice to have contact straight away, pretty well, when the numbers go up. Just to see what we can go & do... I don't press the numbers for no reason."*

Carl, 56 yrs

# Willingness & motivation

- ❖ Computer familiarity, fears & friendship  
*"when you first use it you are following the instructions & over...a short distance of time, that you don't have to look up the instructions anymore, you can memorise them & ...away you go."*  
Neville, 78 yrs
- ❖ I should be looking after him!  
*"I forget to come & do it. I am that busy looking after that kid over there... it is a pain in the arse."*  
Alice, carer
- ❖ Not the same as a human  
*"You are talking to a person instead of a machine."  
"And a person can think, you know. They can't think."*  
Richard, carer  
Joan, 71 yrs
- ❖ Motivation to participate  
*"I just sort of felt, I really need to let them know that there is something else wrong because he hasn't, I don't know if he had written it or not."*  
Michelle, carer  
*"so I am just a person who just gets on with it so I feel no need for it for my personal use."*  
Julie, carer

# Complexity & simplicity

## ❖ Complexity of self reporting

*"I think probably the hardest thing is working out maybe what, how high some of the symptoms should be."*

Joe, 64 yrs

*"Well the thing is in the morning, it can be real bad & then in the afternoon it has gone off. So how do you?"*

Frank, 70 yrs

## ❖ Where you put that extra bit in

*"I wanted to put in about the pressure because of the bruise, so I knew there was pressure there so I wanted to alert them to the fact that he was getting pressure."*

Teresa, carer

*"But nothing about depression on there & I thought there should have been. Because us old blokes we get depressed."*

Ian, 83 yrs

## ❖ You just don't want to know!

*"The trouble is when you are wide awake all night then you have to get on the iPad but you don't want to go on the iPad, you don't want to know nothing."*

Paul, 57 yrs

# Strategies to manage challenges

## ❖ I keep pushing different buttons

*"You can't get rid of it but then all of a sudden like you keep pushing different things & it disappears."*

Frank, 70 yrs

*"So now when I do his tablets in the morning & his injections, I get that done & then pull that (iPad) over..."*

Julie, carer

*"So we are trying to put that into the daily routine"*

Mark, 49 yrs

## ❖ Logistics of self reporting

*"It is very easy to give the correct direction to the point where you change over. Whereas your finger, goodness me,...it is far better than using the fingers."*

Mike, 78yrs

## ❖ Strategies for managing drop outs

*"The nurse talked me through it once and then we got stuck with him too. So he said, "Don't worry about it, I will call in." and that day he called in."*

Joan, 71 yrs

# Palliative care here in our home

## ❖ Its personal – face to face

*“I can show him what is wrong with me. I can show them the nodes, like I did today... You are not a number. It is very, that is very important. It just seems more friendly and...more personal.”*

Paul, 57 yrs

## ❖ Communication essentials via video

*“Dad’s hearing & comprehension is a problem... So I think it is important that anyone that has a conference like this does have a family member who understands the person personally.”*

Mary, carer

## ❖ Connecting clinicians

*“having everybody together on the same wavelength instead of 5 interviews we had last week...I think I counted up 9 hours.”*

Mary, carer

## ❖ Managing care needs with minimum burden

*“The travelling’s an absolute nightmare... It [videoconference] saves me three to four days of agony. By the time I get back in my bed it feels like I have run three marathons. And I don’t eat nothing, I don’t drink anything. All I want to do is sleep.”*

Mark, 49 yrs

# Conclusions

- ❖ People with advanced disease are willing & able to self report symptoms & function
- ❖ Willingness to participate is influenced by
  - experience with/attitudes towards technology
  - follow up on alerts by clinicians
  - reliability of connection
  - perceived value
  - reciprocity (benefit for others in future)
- ❖ Ability to participate is influenced by
  - an internet connection
  - timing of telehealth (too late – too sick, too early – no perceived benefit)
  - clinician encouragement, education, support & flexibility
