

## **Driving jobsite efficiencies through better data**

Maximizing equipment utilization and keeping crews working efficiently are two areas where many contractors would like see improvements made in their operations. Today's onboard equipment technology and productivity tools can help to identify areas of inefficiencies and redundancies so they can be addressed and improved. Through the use of telematics, contractors can capture and analyze equipment hours, track machine location and report operational data. Project planning tools, like bore planning and mapping software, can help reduce redundancies, improve communications and help maximize on-the-job efficiencies through every phase of a project.

Come learn about how utility contractors are using telematics and project planning tools to help drive efficiencies into their business. You will hear testimonials about how tools like telematics and bore planning and mapping software have helped secure work and improved contractors' operational efficiencies.
