

What is missing in our research infrastructure is data!

Professor Brian Vinter

Reuse data!

Why share data?

Honesty in science

- Fraud will always be around but harder with open data

Reproducibility

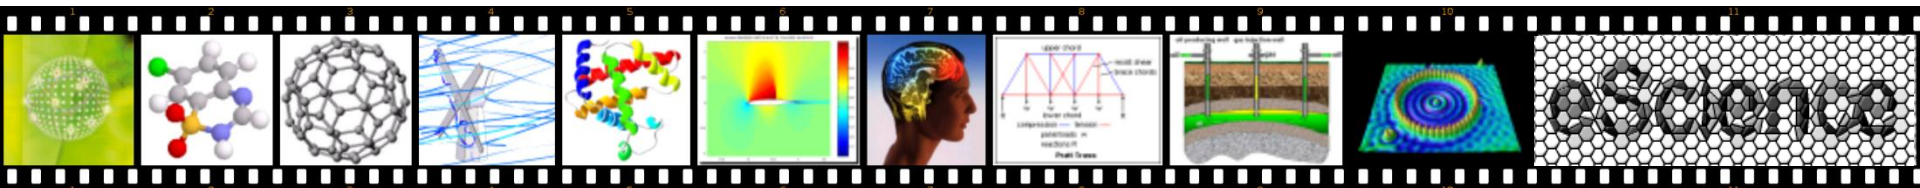

- It is a lot cheaper to reproduce results with access to the original data

Value

- Datasets may hold much more data than the original investigation expected

Teaching

- Students learn so much more from working with real-world data

How to share data

By law

- Simply put data that is collected using public funding should be public available

By funding agency

- Simply require data to be made available, and that a portion of the research budget is set aside for data archiving

By technology

- Extremely simple, infrastructure for storing data is already widespread and very inexpensive
