# Licensing issues for new build consortia

*Aligning milestones and attracting investment*

**Vanessa Jakovich, Counsel, London**

**WNA New Build Licensing Conference, 21 April 2015**

# Why is licensing crucial to attract new build investment?

---

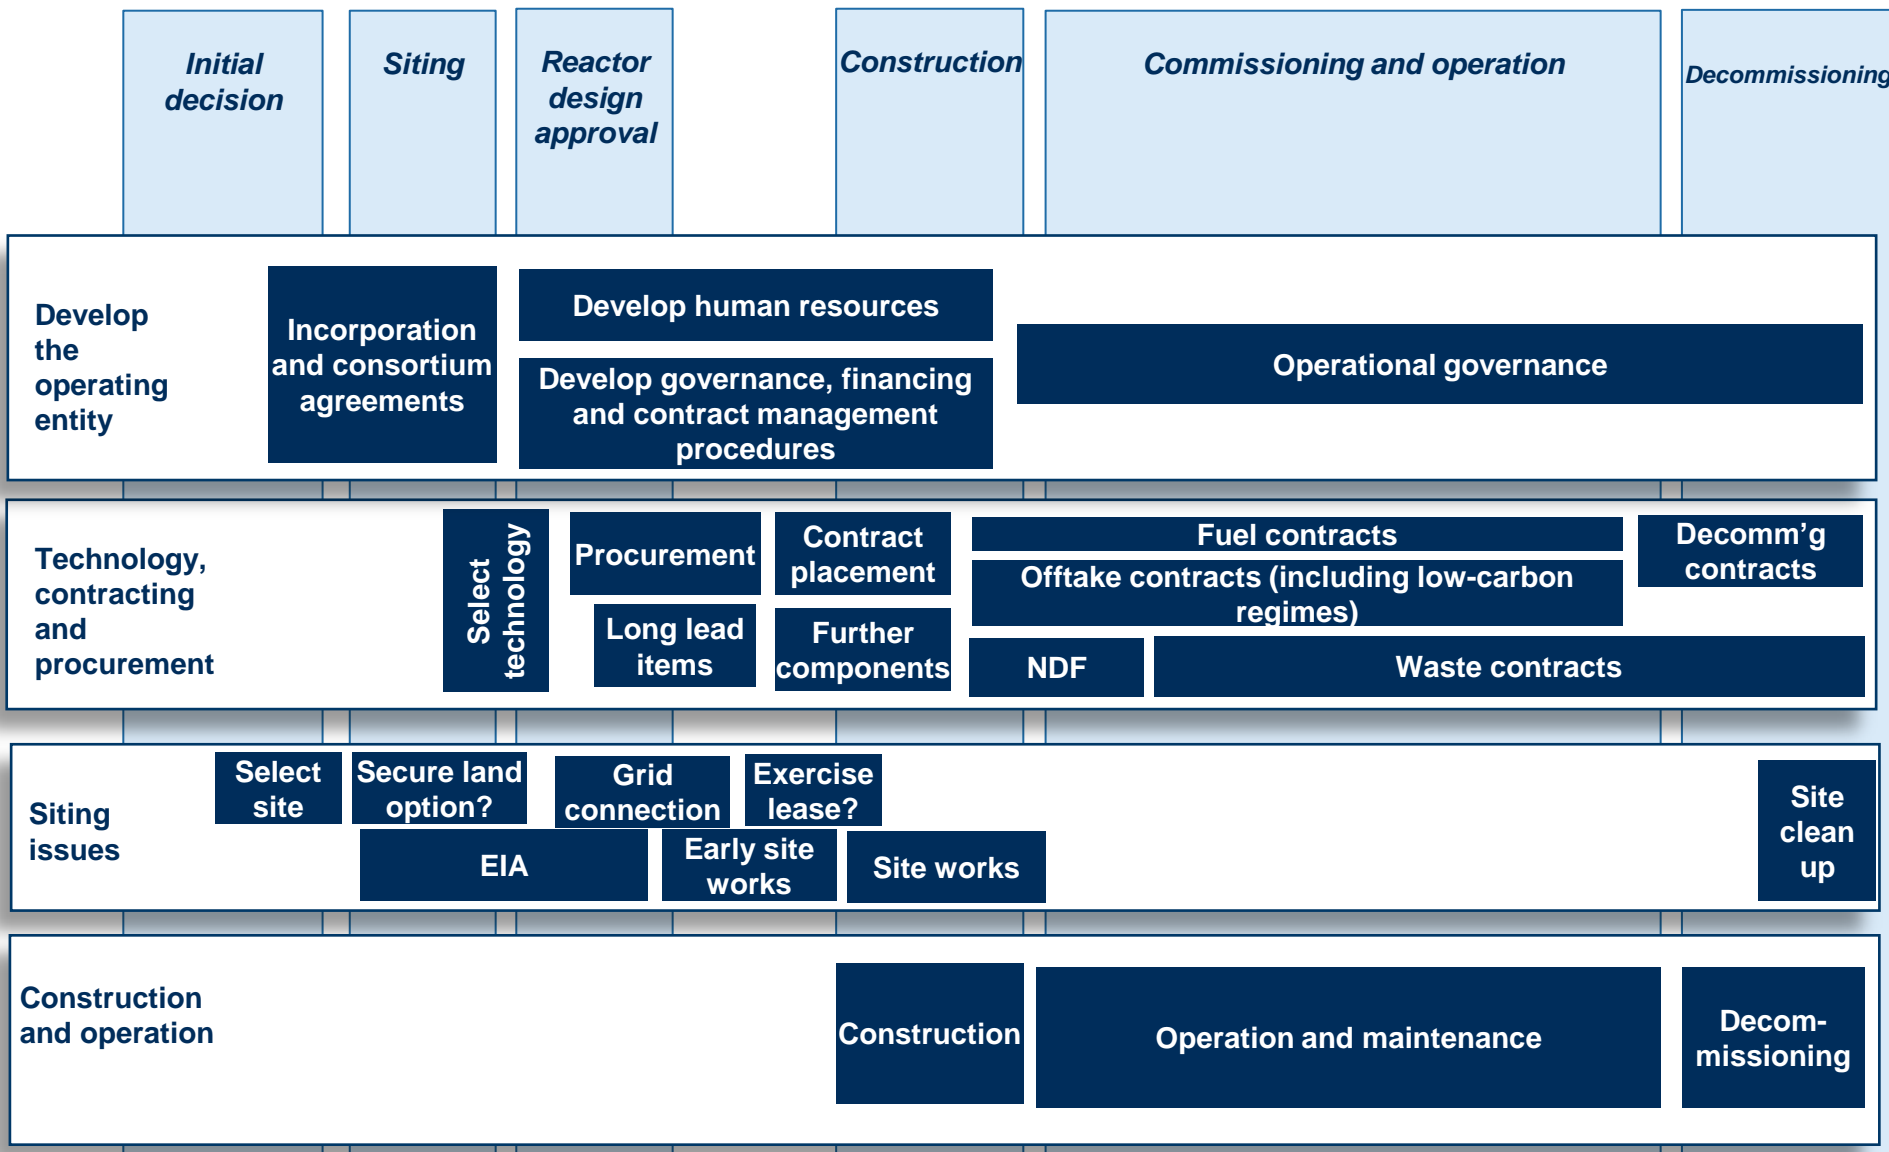

## Who are the nuclear consortia of the current renaissance?

- Increasingly **private**
- Increasingly use **industry equity** for seed funding (cf: debt/project finance availability)
- Massive investment required means no longer just utility driven
  - Increasingly **cross-disciplinary**
  - **Reactor vendors** driving consortia creation
  - Also **outbound** investment from **emerging** nuclear markets into older nuclear markets, for purpose of building expertise (eg, China into UK)
  - Massive investment means there is also a need to facilitate later investment by **non-nuclear** investors (eg, pension schemes) who can have less operational input
  - Also means nuclear is competing with classic infrastructure projects for traditionally conservative investors, so consortium agreements need to accommodate that lower risk appetite
- Competitive market for skills and resources forces **organic growth** of a “licensable entity”

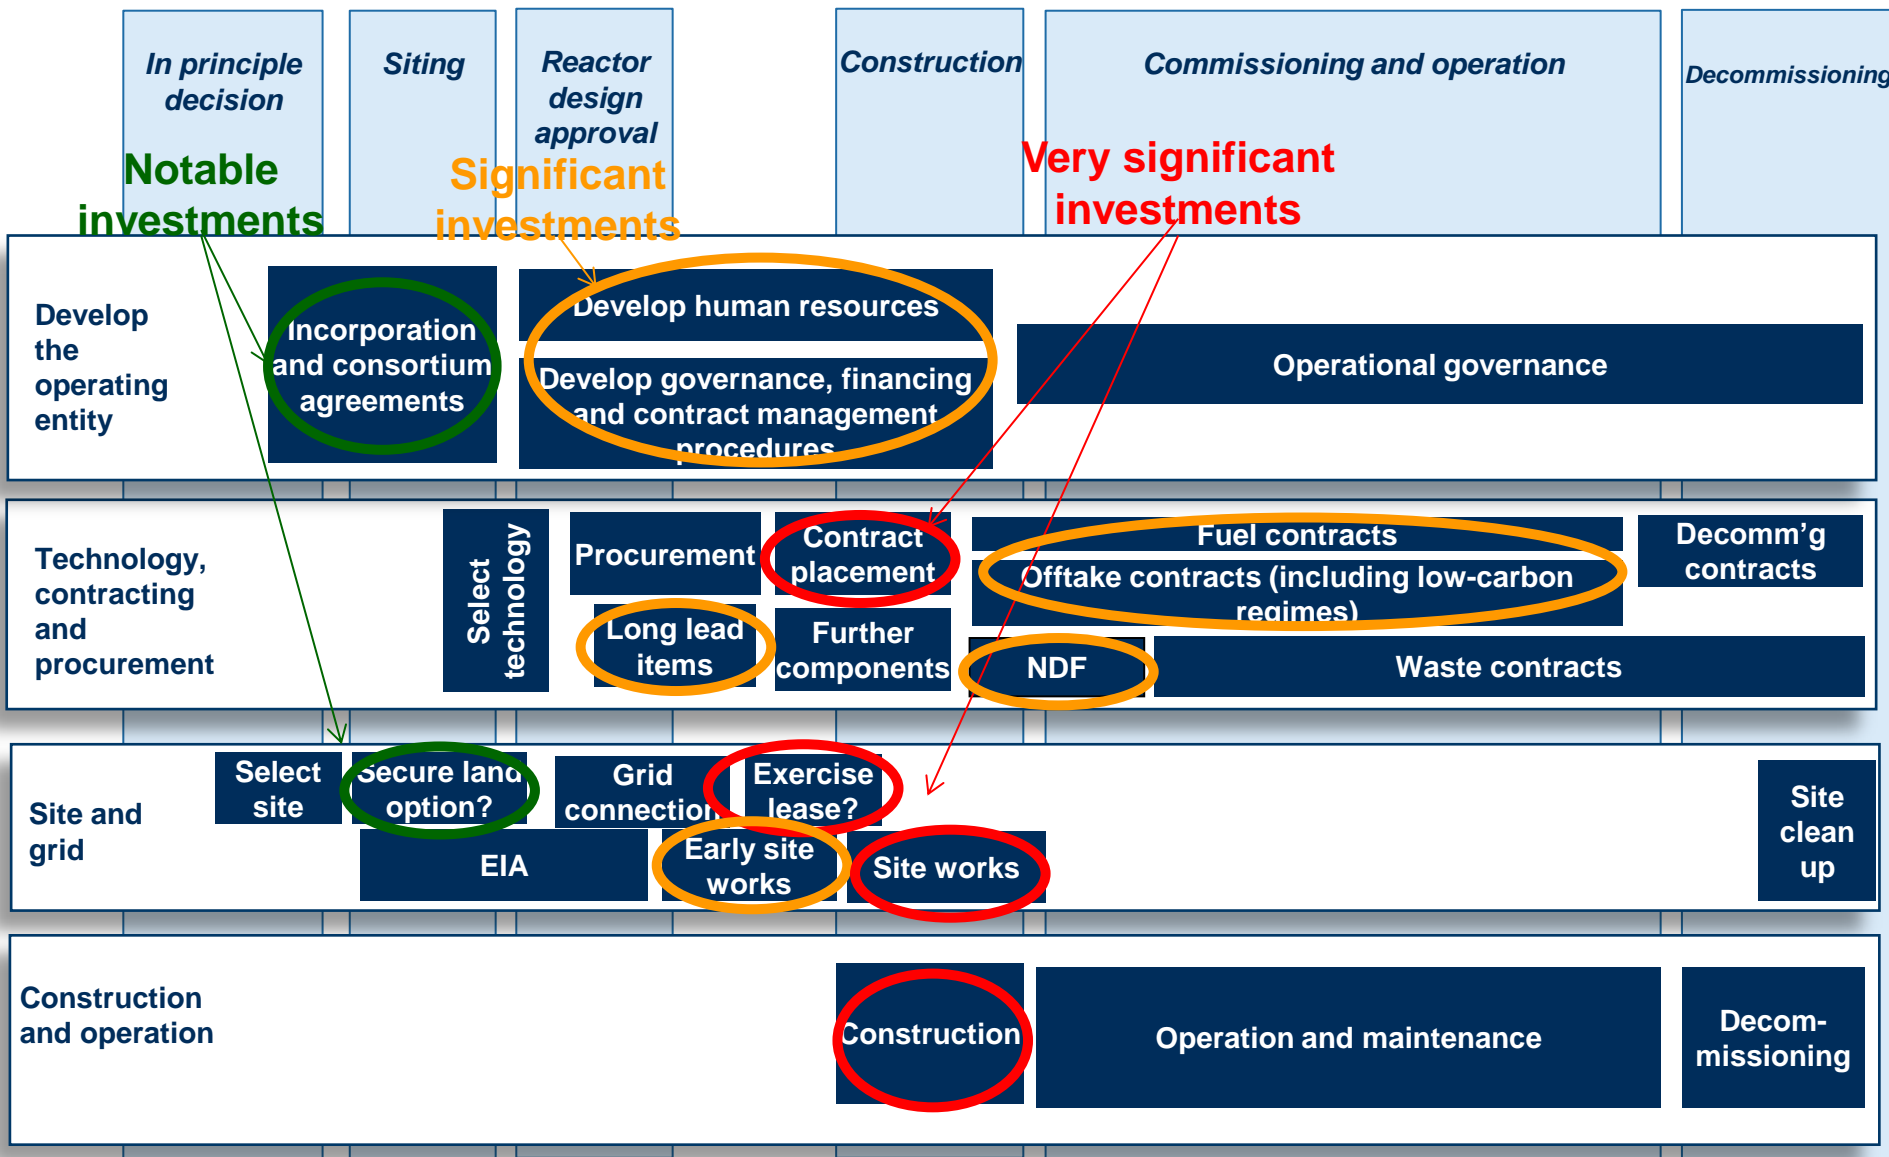

## Licensing drives the size and shape of these consortia

- Can be decisive in making project consortia investable
- How is this being managed?

# Key project phases

# Key project investment milestones

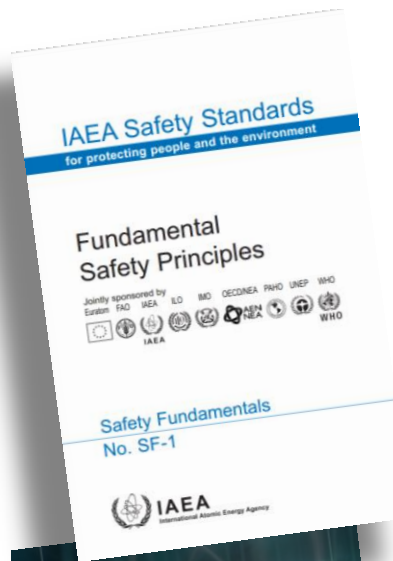

# How do licensing issues affect commercial timelines?

Stage	Consortium agreement considerations
Securing a <b>site</b> and characterising its suitability	<ul style="list-style-type: none"> <li>• Land option (and government strategic siting commitments)</li> <li>• Land purchase <b>costs</b> / Lease premiums and obligations</li> <li>• <b>Site characterisation</b> (including risk from works; grid connection; workforce; exit planning; legacy liability from site characterisation works?)</li> <li>• Making the site suitable (eg, legacy nuclear neighbour) contamination</li> </ul>
Building a “ <b>licensable entity</b> ”	<ul style="list-style-type: none"> <li>• Committing stable, consistent <b>expertise</b> (the right mix of investor expertise; exit restrictions; investor secondment obligations)</li> <li>• Ensuring <b>corporate governance</b> meets regulator’s standards (independence; stability; expertise – intelligent customer status)</li> </ul>
Selecting and certifying a <b>reactor design</b>	<ul style="list-style-type: none"> <li>• Technology competition processes</li> <li>• Justification</li> <li>• Design certification – costs; timing</li> </ul>
Securing a reliable <b>supply chain</b>	<ul style="list-style-type: none"> <li>• Ensuring <b>supply chain</b> is capable of meeting regulator expectations</li> <li>• Ensuring delivery (eg, early long-lead items) is committed to be made at the <b>right time</b></li> <li>• Securing a main contractor, or means to coordinate <b>project delivery</b></li> </ul>
Developing relationships with <b>stakeholders</b>	<ul style="list-style-type: none"> <li>• Ensuring enough stability, early design and planning for meaningful <b>community</b> engagement</li> <li>• Strategy for <b>engagement with regulators</b></li> <li>• Making and supporting licence and permit <b>applications</b> (and defending legal challenges)</li> </ul>

# The IAEA and nuclear licensing laws

---

## SF -1 Fundamental Safety Principles

- Establishes the principles on which the Convention on Nuclear Safety is based

## Handbook on Nuclear Law

- Recommendations regarding the basic characteristics of licensing laws:
  - Availability of licences
  - Application processes
  - Public participation
  - Criteria for issuance
  - Issuance and form of a licence
  - Suspension, modification or revocation
  - Review of licensing decisions
  - Inspection and enforcement measures
- Non-prescriptive as to process

# Licensing requirements under international law: back to basics

## Objectives in Article 1

- To achieve and maintain a high level of nuclear safety worldwide
- To establish defences in installations against radiological hazards
- To prevent and mitigate accidents with radiological consequences

## Requirements

- **Article 7(2):** Countries must have a system of licensing, prohibit operation without a licence, and ensure inspection, assessment and enforcement
- **Article 9:** Licensed operators must bear prime responsibility

**The permission principle and prime responsibility**

- **Article 10:** Licensed operators must have policies prioritising safety
- **Article 11:** Licensed operators must have sufficient financial and human resources to ensure safety

**Qualifying as a licensable entity**

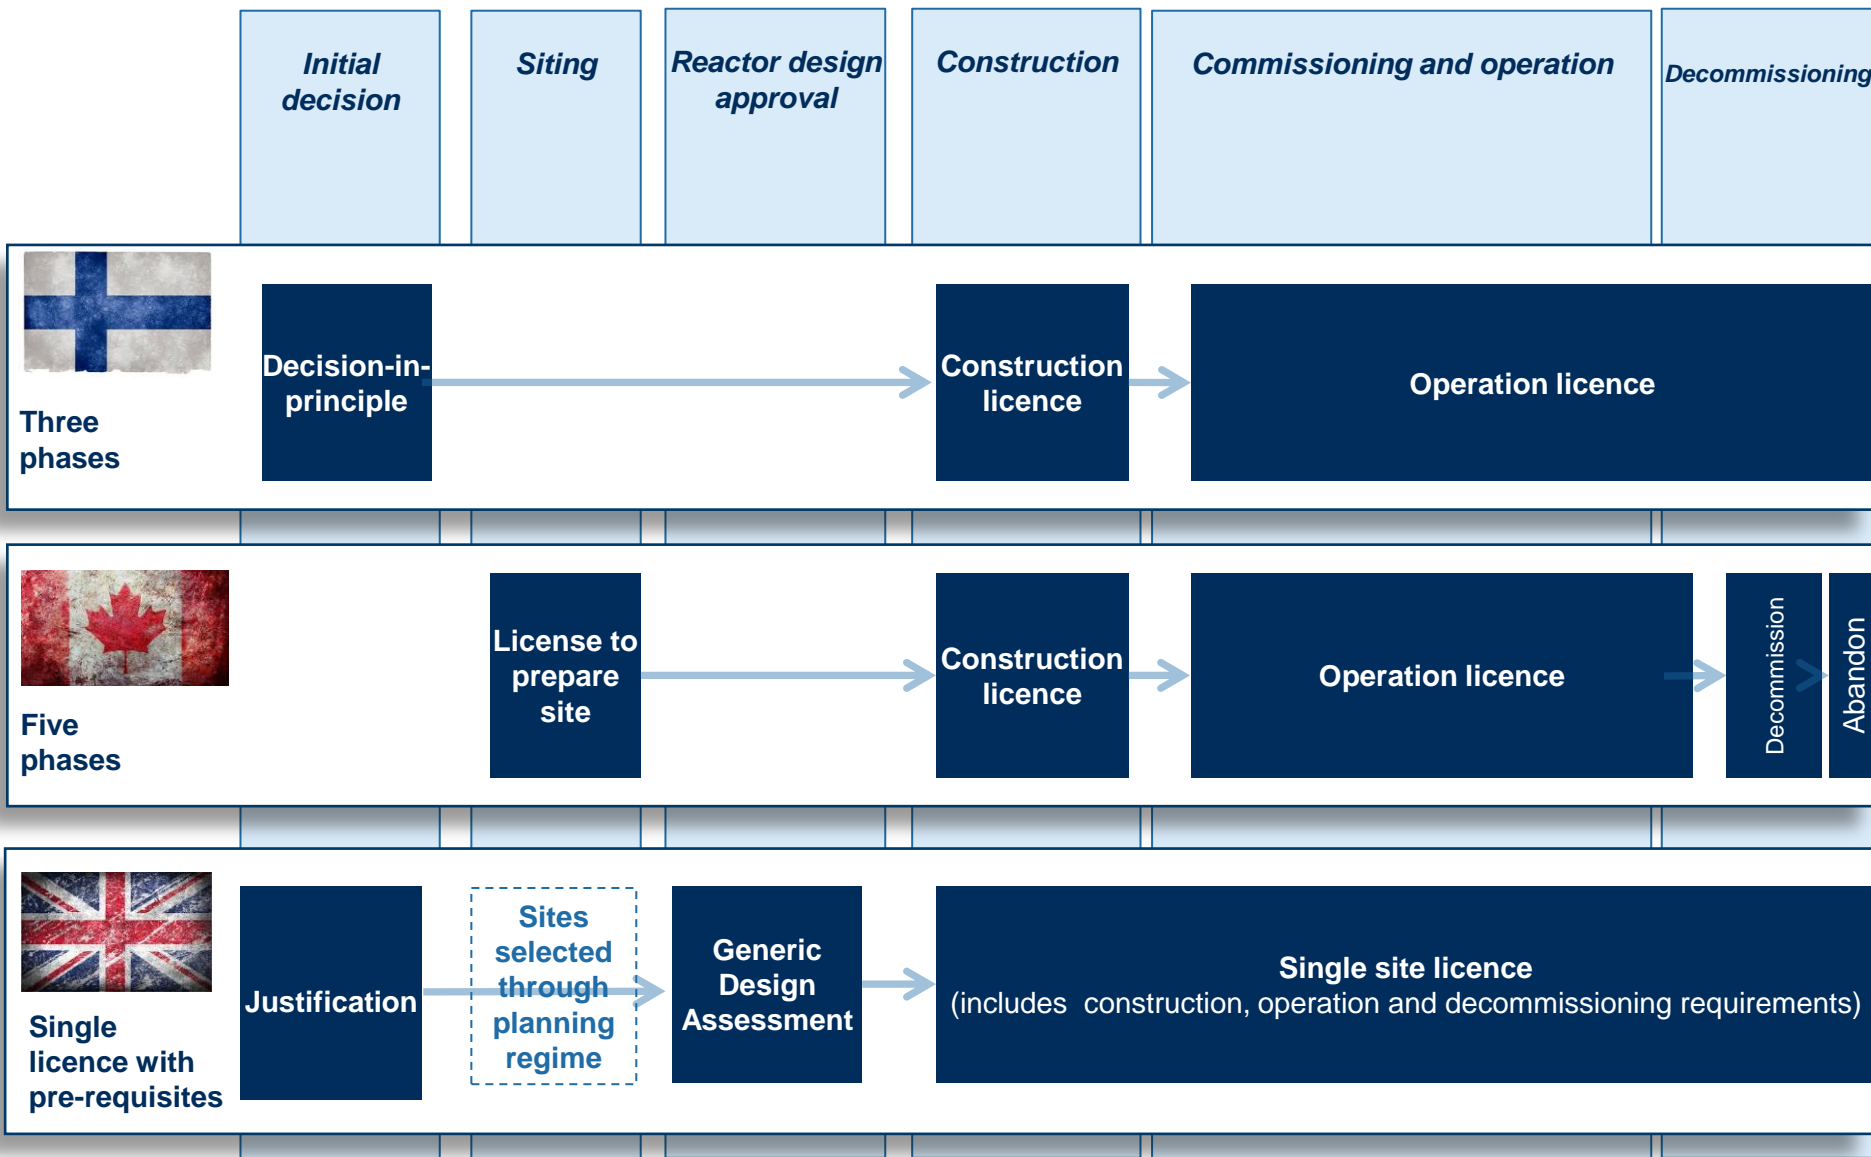

- **Article 14:** Comprehensive safety assessments required before construction, commissioning, and through the project's life
- **Article 17:** Siting and consultation processes

**Safety assessments and siting**

- **Article 18 - Design:** Construction and technology must include defence-in-depth, be proven or qualified by testing, and be reliable and stable.
- **Article 18 0 Operation :** Must accord with a safety case, use established procedures, constantly improve, and minimise waste.

**Substantive project requirements**

# Examples of licensing models: phases

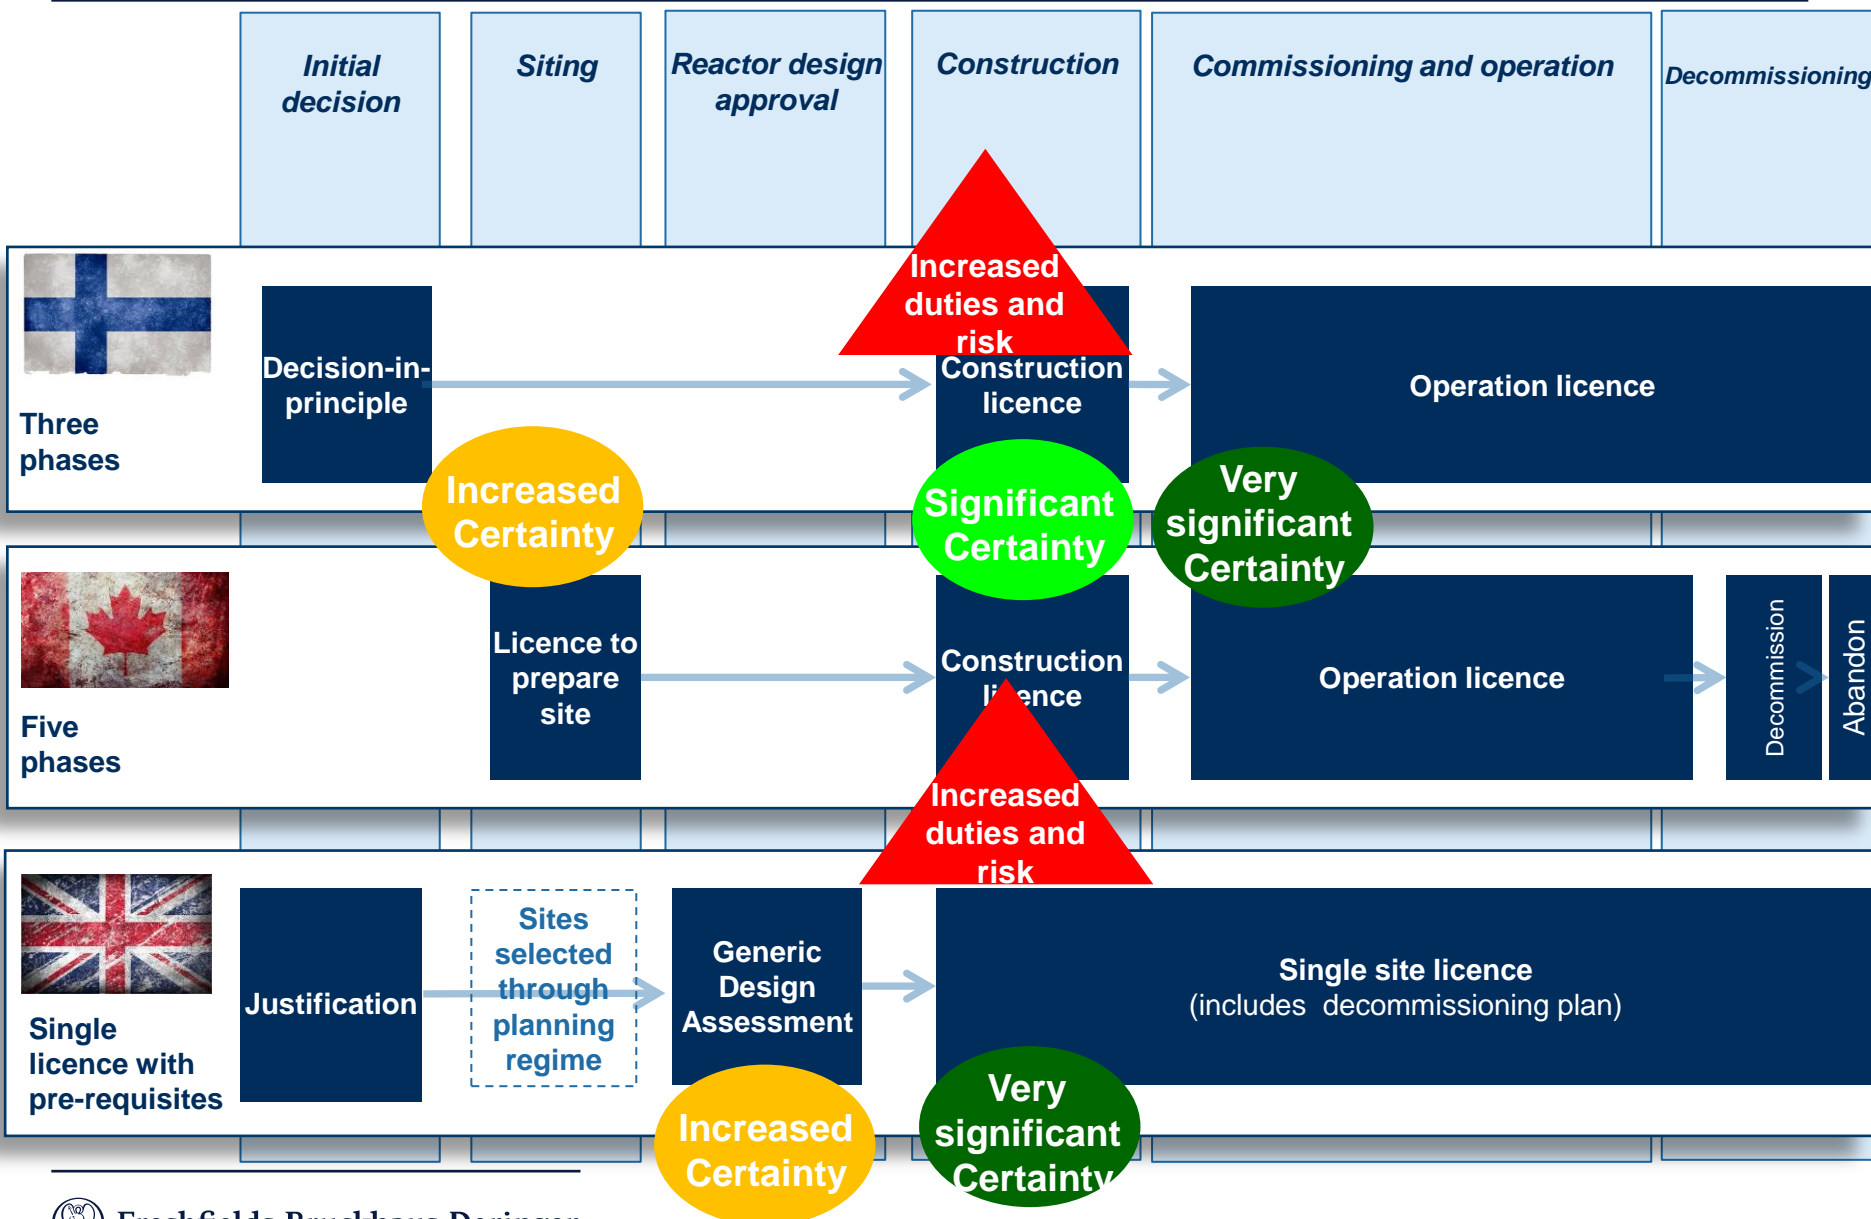

# Aligning milestones and attracting investment

---

- **How do these licensing steps align with investment timelines?**
  - **Interdependencies** between licensing and investment milestones require **strategic planning** and careful management
  - Consortium agreements need to align with key licensing stages for many reasons:
    - **Certainty:** To harness the increased certainty from the grant of key approvals, as pre-conditions to major investment decisions/commitments
    - **Resources:** To ensure parties commit to provide the necessary resources to facilitate the completion of licensing phases – both expertise *and* finance
    - **Risk:** To ensure that liabilities and duties are not triggered until the consortium is adequately resourced and committed – and to create an exit plan
  - Licensing regimes need to be stable and predictable to make this possible

# Commercial risks in phases of licensing

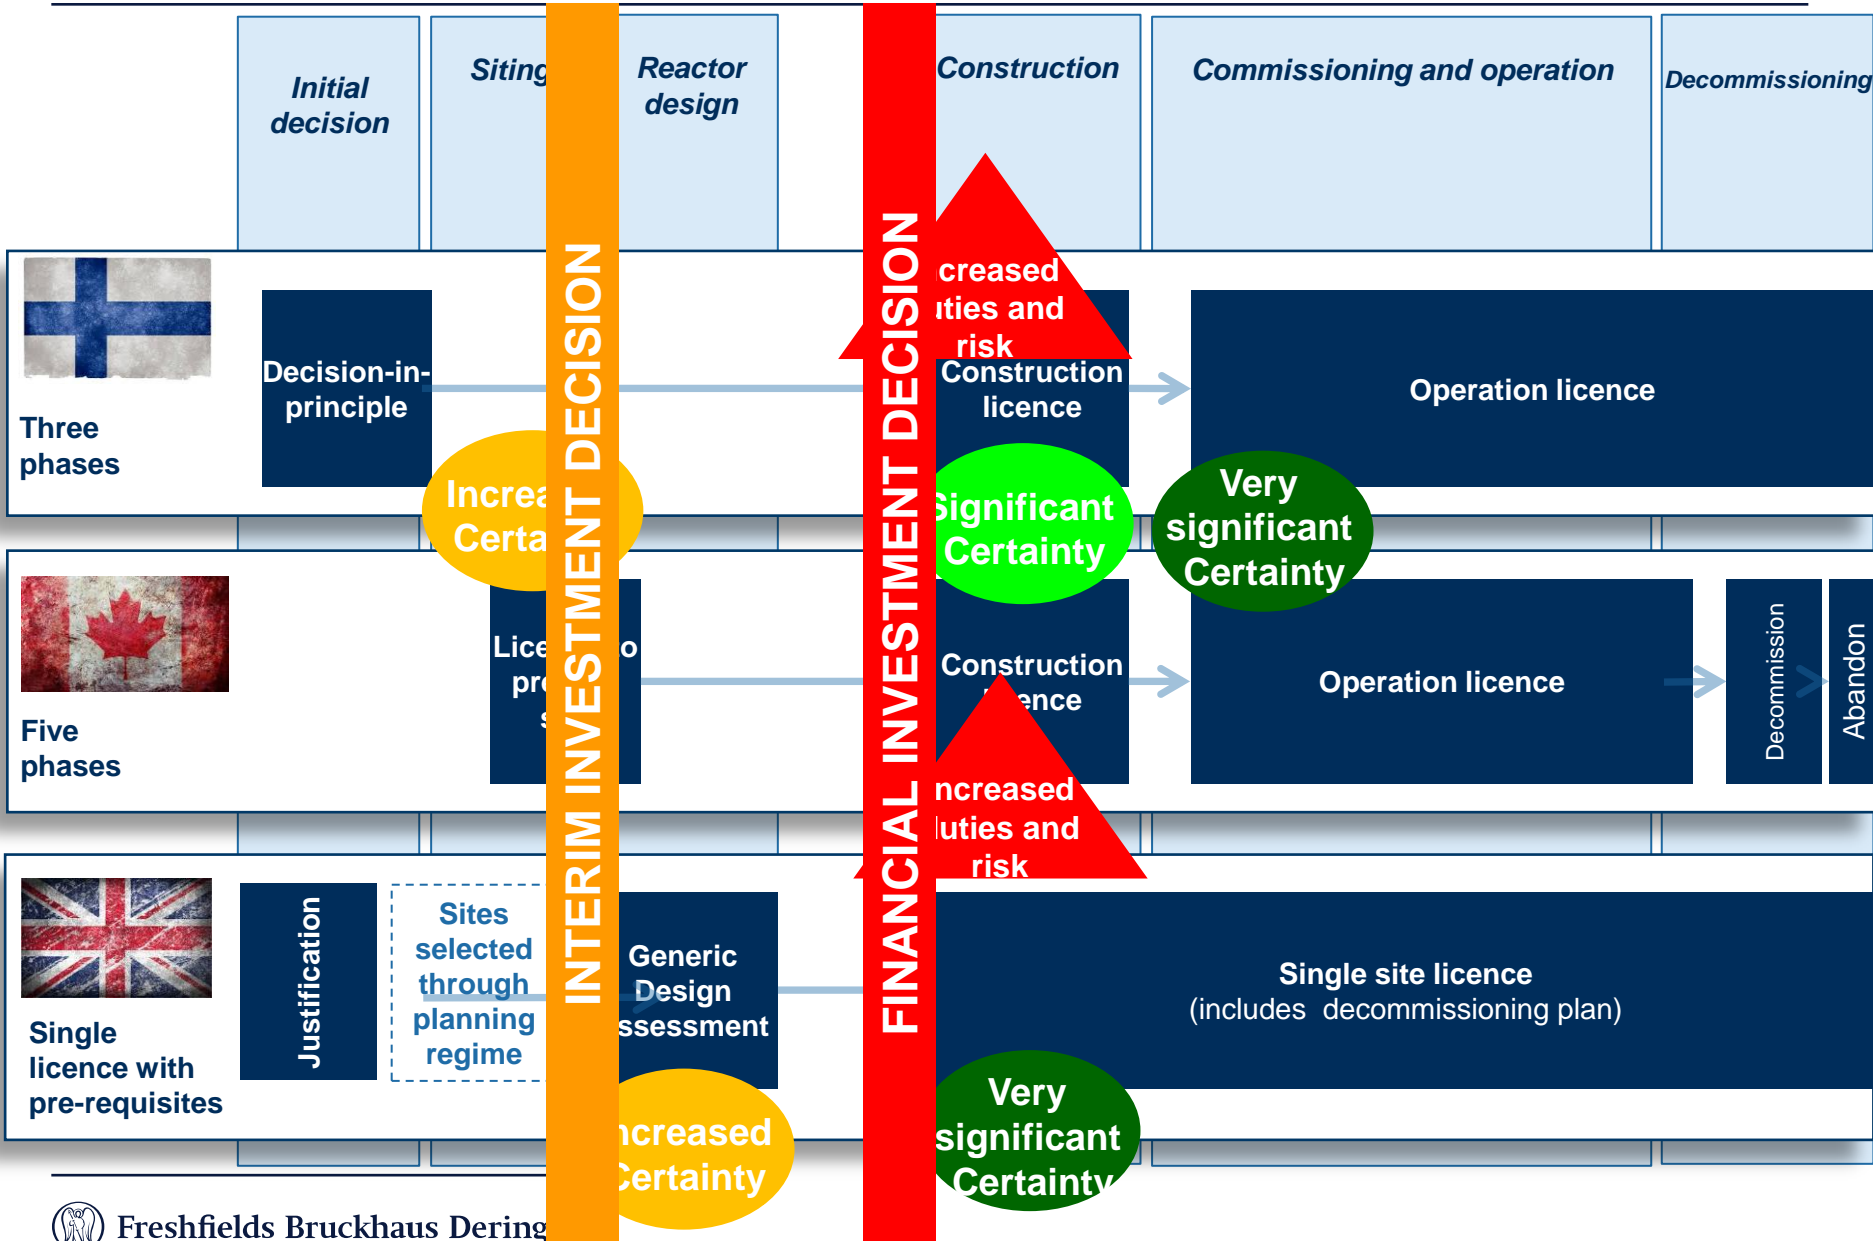

# Dealing with licensing risk in Articles and Shareholder Agreements

---

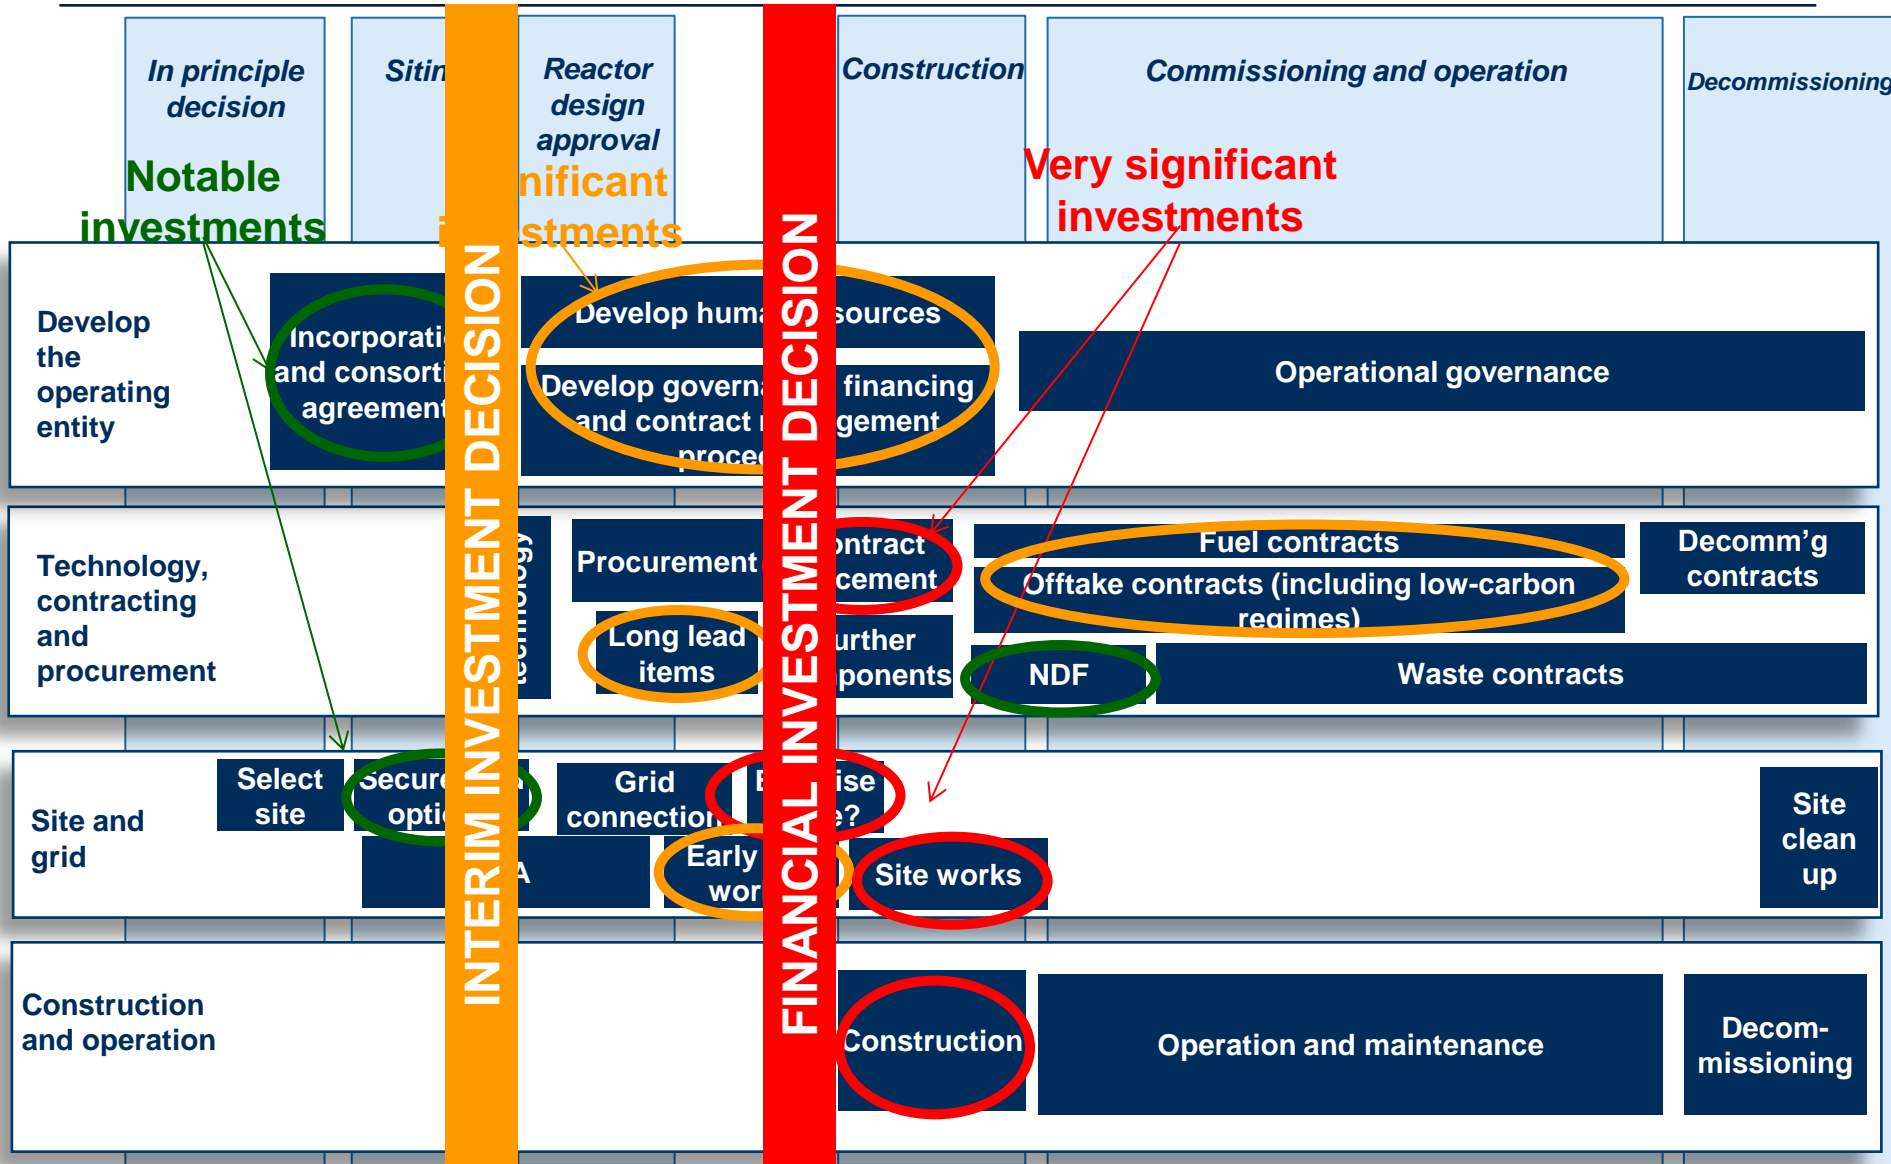

## What do vendor-driven, multi-disciplinary consortia mean for licensing and permitting timelines?

- **Alignment of key milestones**
  - Increases ability to identify obvious points to increase investment obligations in consortia agreements
  - Careful management needed – more licensing processes on the critical path
- **Parallel processes:** Vendors less willing to fund pre-licence design certification without a customer
- **Exit:** Unlike utilities, participant interest changes over the life of a project
  - Consortium agreement exit become important
  - Managing “licensable entity” status an important consideration
- **Diversity:** Impacts of difference between consortia members cannot be underestimated
  - Culture, background and area of discipline affect everything: project pace, risk appetite, communication, stakeholder engagement, etc

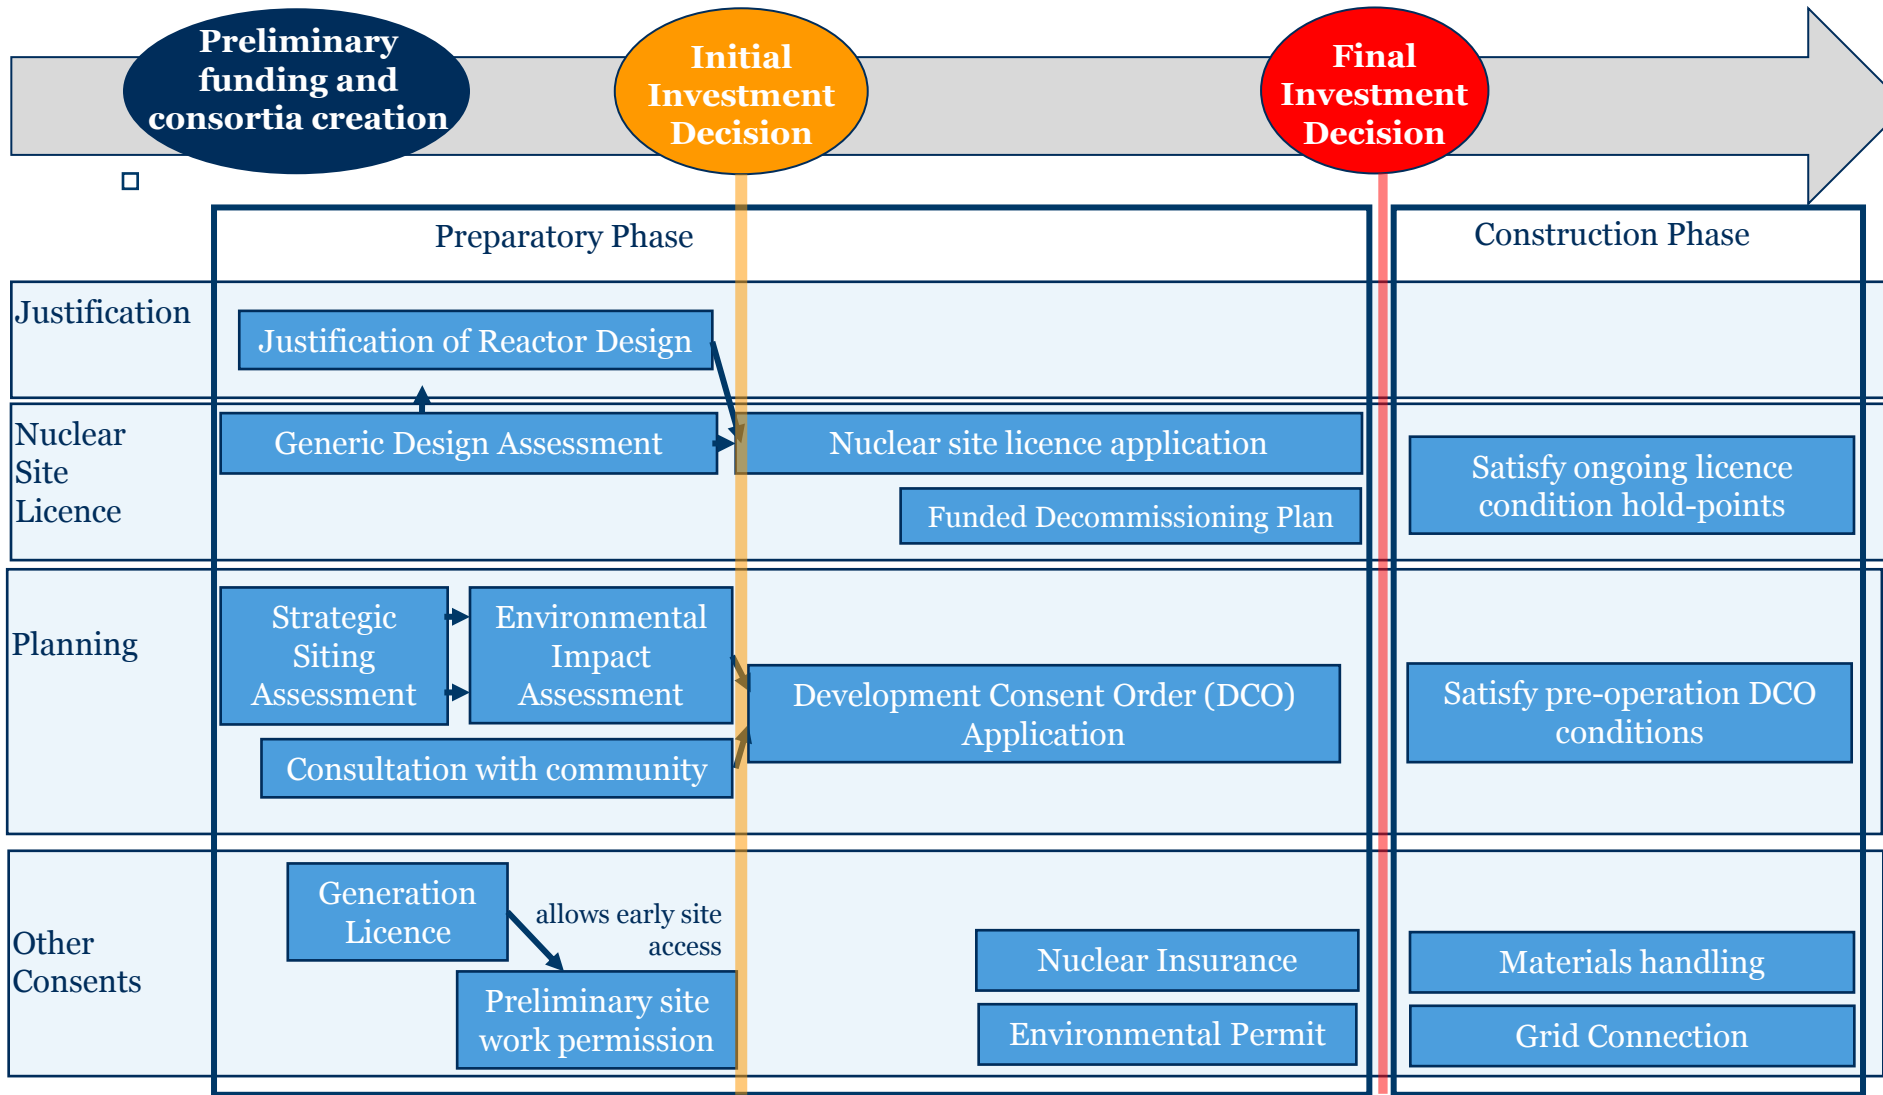

# Aligning investment decisions with licensing risk

# When do consortium agreements provide for investment decisions?

# UK example: Nuclear new build consents

# Dealing with licensing risk in Articles and Shareholder Agreements

---

## Managing risks crystallised by licensing processes – example of contamination

- **Strong trend for new build sites in mature markets to neighbour legacy sites**
  - Reasons for **original siting** decisions tend to endure: eg, cooling water, seismic stability, visual impacts, transport
  - Existing **grid**
  - Workforce and **skills**
  - Government policy
- **Presents new and interesting challenges**
  - Risk of neighbours impacting on each other's **safety cases** (generating v generating/decommissioning)
  - Risk of legacy **contamination** on new build site
  - Competition for local **resources**: transport and access; workforce; grid capacity
  - Cumulative radiological dose impacts?
- **What does a legacy nuclear neighbour mean for licensing and permitting timelines?**
  - Legacy contamination **liabilities**:
    - Grant of new licence can immediately channel the legacy liability to the new operator
    - Need to ensure licence not granted until project definitely proceeding

# Dealing with licensing risk in Articles and Shareholder Agreements

---

## Engaging regulators to manage commercial risks in licensing timelines

- **Timing**

- Increasing certainty and predictability (eg, UK planning reforms)
- Holding consents with immediate implementation costs: for synchronisation with project investment milestones

- **Predictability**

- Early engagement
- Early design certification
- Electricity markets

## Harnessing political goodwill to facilitate licensing and permitting

- **Community engagement:** alignment of national and local processes to facilitate parallel regulatory processes
- Building the **supply chain**
- **International** relations

**The future:** Increasing interest from regulators and governments to identify future opportunities to improve coordination of licensing processes with investment and development processes.

INFCIRC/449

Annex

page 2

## CHAPTER 1. OBJECTIVES, DEFINITIONS AND SCOPE OF APPLICATION

### ARTICLE 1. OBJECTIVES

The objectives of this Convention are:

- (i) to achieve and maintain a high level of nuclear safety worldwide through the enhancement of national measures and international co-operation including, where appropriate, safety-related technical co-operation;
- (ii) to establish and maintain effective defences in nuclear installations against potential radiological hazards in order to protect individuals, society and the environment from harmful effects of ionizing radiation from such installations;
- (iii) to prevent accidents with radiological consequences and to mitigate such consequences should they occur.

# Thank you
