

Australia's Contribution

Science will underpin solutions to the great challenges humanity faces: food security, water, climate change and energy to name a few;

None will be solved by individuals or individual nations on their own; the international community will need to work together.

Australia: a small population with a large land mass and coastal zone, geographically close to much of the developing world;

Australia: has always collaborated in science.

Australia: has developed the world-class research infrastructure needed to support multidisciplinary research to address the great challenges including data management and e-infrastructure.

Australia: a blend of quality science with cultural diversity and wide-ranging biogeographic characteristics present unique challenges and
